

OpenIDM 101

OpenIDM 101

Speaker: Mattias Tristl

OpenIDM

- Determines user was created, changed, etc.
- Is a central point to provision users
- Synchronization engine
- Reconciliation (make sure user exists)
- Central password distribution point
- Cloud-based service for maintaining users
- Enables user self-service
- Data validation

Provisioning

- Get accounts on backend systems and create
- Get default group/role membership
- User self-service
- Multi-account linking

De-Provisioning

- Delete user on external systems
- Deactivate user on external system

OpenICF

- Used to speak to external systems in their language

OpenIDM has hooks for scripts all over the place – you can choose to use them or not

With OpenIDM, you can use our user interface & brand it, or you can use your own

Follow up: None
