

root-context

A root-context object is the parent context object to all further contexts.

Usage

```
{  
  "type": "root",  
  "uuid": string,  
  "parent": null,  
}
```

Members

"type": "root", required

Specifies that the context is a root-context type.

"uuid": string, required

See [context object](#).

"parent": null, required

A root context has no parent; must always be null.
